AFTERCARE

Aftercare is vital when it comes to preserving and maintaining your Ceramic Coating, PPF and Vinyl vehicle wrap.

To ensure optimal protection and benefits from Ceramic Coatings and PPF, proper & regular vehicle washing is required.

Like all great things in life, maintenance is key! Maintenance enables protection to perform their best by avoiding contamination build up.

Some contaminants such as fall out (brake dust are very aggressive and are capable of clogging your protection surfaces if left to dwell on surfaces, potentially affecting how surface protection technologies work.

CERAMIC NANO COATING

1-7 DAYS AFTER INSTALLATION

You just picked up your vehicle from us after receiving a Ceramic Coating, what now? For the first 1-7 days after your ceramic coating installation, keep your exterior as clean as possible.

Immediately after the coating is installed, please do the following:

- The longer the vehicle can be left to cure, preferably untouched, the better.
- No unnecessary water exposure or car washing for seven days.
- Do not use a car soap with the words “wax” or “gloss” in the name or description. We recommend 3D Pink Car Soap, FEYNLAB PURE WASH, or Optimum No Rinse (ONR) for Waterless or Rinseless washing methods. Dilute this with 1/2oz to 2 gallons of DISTILLED water.
- Keep a regular vehicle wash schedule. i.e. once every two weeks for daily drivers.
- Every wash, be sure to use the recommended Ceramic Quick Detailer to protect and add hydrophobic beading products to the existing ceramic coating top coat. Using the recommended quick detailer builds up layers of protection over time. This is the best strategy to ensure painted surfaces remain at their optimal state for both performance, aesthetics and longevity.
